Tegutseda mõõdetavate tulemuste nimel

- Laialt levitatud poliitiline eesmärk on kliima soojenemise kasvu pidurdamine
- Toetada saaks ja tuleks mõõdetavat CO₂ ringlusest eemaldamist, soovitavalt naturaalsel meetodil

Reaching the 1.5-degree warming target could require a large quantity of negative emissions, including some generated using carbon credits.

Global carbon-dioxide emissions, gigatons (GtCO₂) per year

¹Global Energy Perspective.

²While emissions fell by a quarter at the peak of COVID-19-related lockdowns, daily emissions have rebounded to be only 5% lower than 2019 levels. Scenarios to 2050 remain the same. Forster et al., "Current and future global climate impacts resulting from COVID-19," *Nature Climate Change*, August 7, 2020, nature.com.

³Budget of 570 GtCO₂ emissions from 2018 onward offers a 66% chance of limiting global warming to 1.5°C, when assessing historical temperature increases from a blend of air and sea-surface temperatures.

Fraunhofer-Gesellschaft

At a Glance

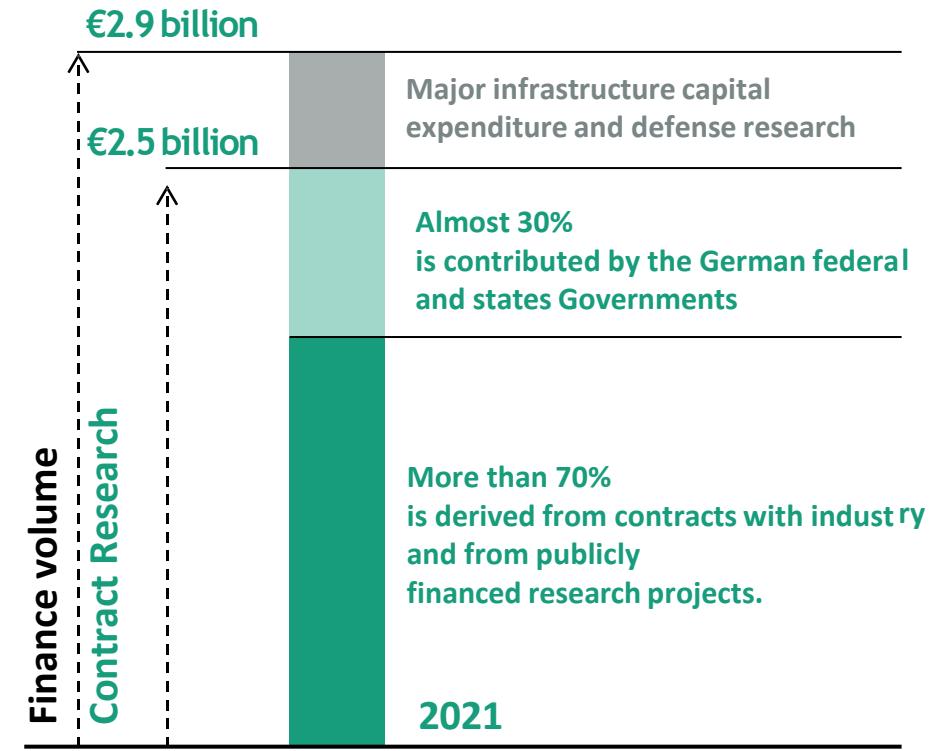

Applied research organization prioritizing key future-relevant technologies and commercializing its findings in business and industry. A trailblazer and trendsetter in innovative developments and research excellence.

30 000 staff

76 institutes and research units

Fraunhofer UMSICHT - Pioneer for a sustainable world

Concepts and technologies for shaping the energy and
raw materials transition.

The Thermo Catalytic Reforming Technology (TCR)

Patented Conversion of biogenic residues into sustainable products

Use cases and outcome

- Utilization of biogenic residues
(no food vs. fuel discussion)
- Decentralised application possible
(regional added value)
- Products with near-zero carbon footprint possible

Products

- Syngas with up to 50 % green hydrogen
- Oil with high thermal stability for processing into standard fuels
- Coal for soil application / storage / energetic use

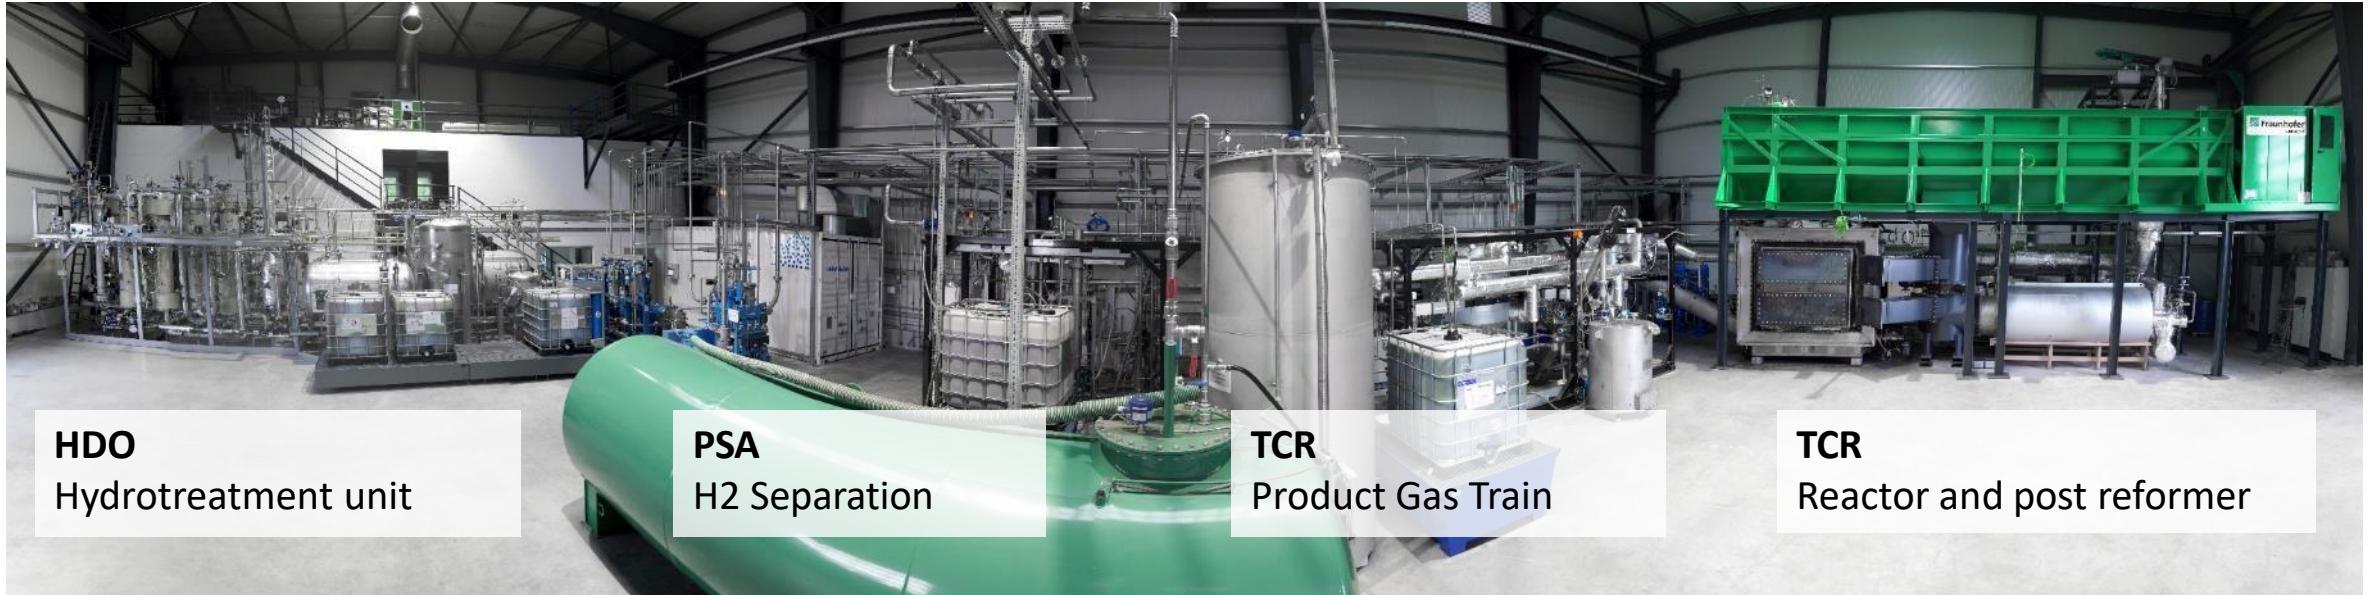

TCR-technology

Demonstration site for waste-to-fuel

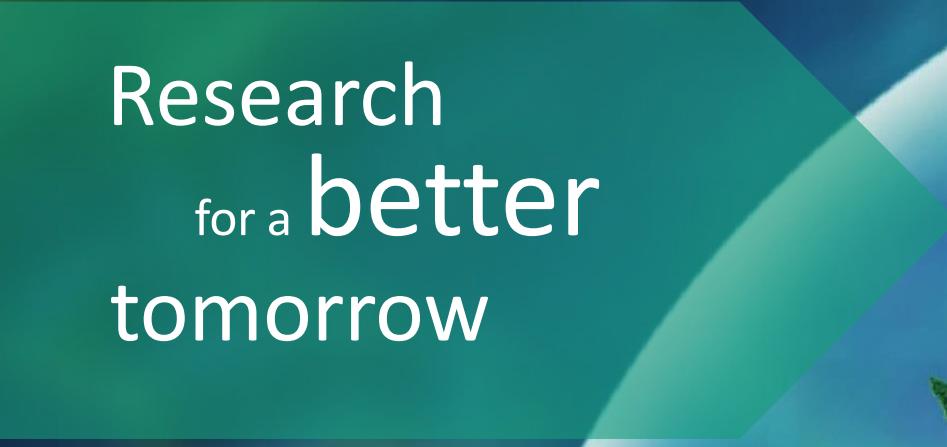

TCR-technology

Demonstration site for waste-to-fuel

- Pre-commercial demonstrator in Hohenburg, Bavaria, Germany
- Value chain from feedstock via conversion unit (TCR), separation of Hydrogen from synthesis gas (PSA) and upgrading of bio-oil to fuel quality (HDO)

Superheated steam at atmospheric pressure

Working principle

Commissioning

Heating the air inside the chamber to the desired operational temperature;

Creating the atmosphere superheated steam through the evaporation of fine water droplets (or injection of saturated steam);

Continuous operation

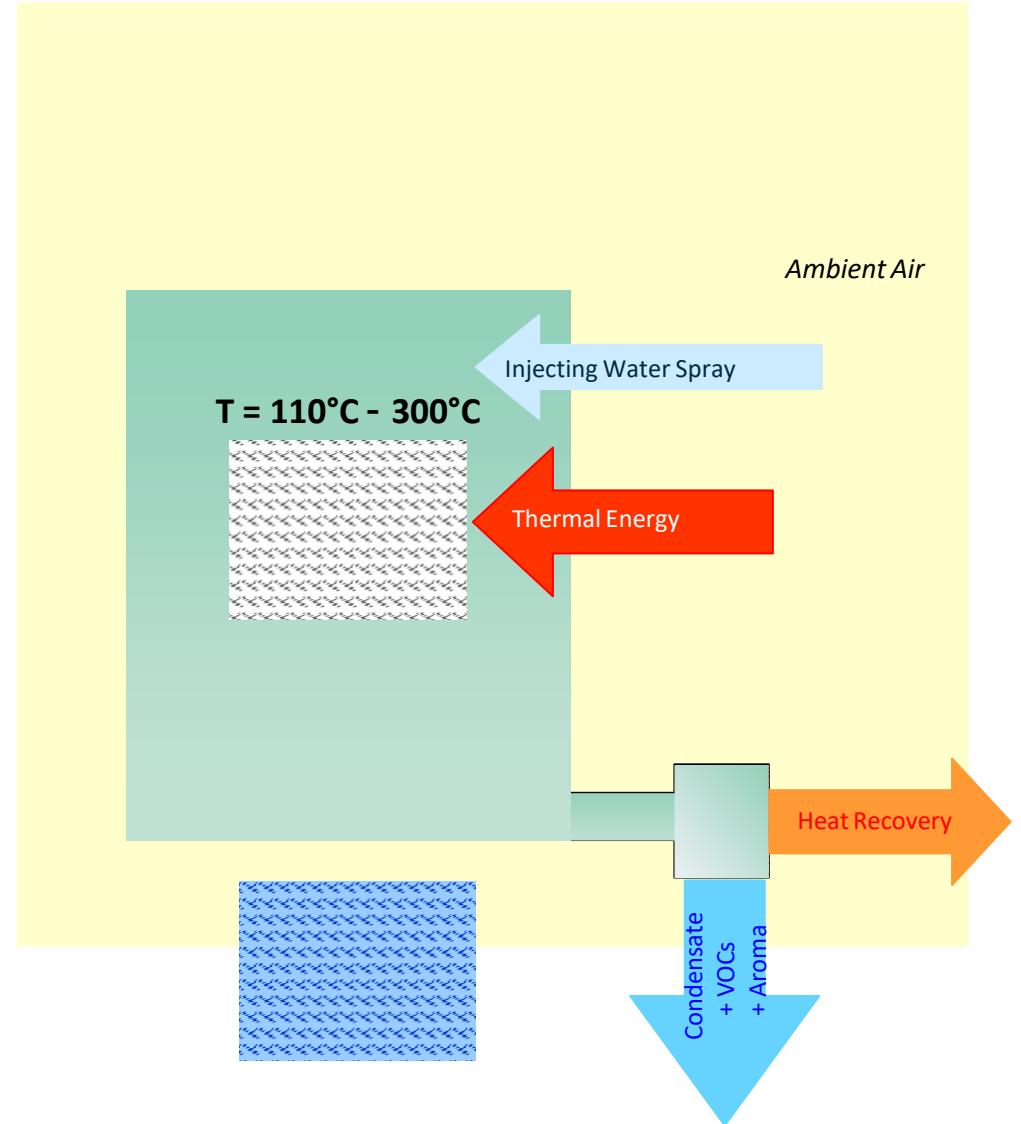

Loading material into the chamber;

Volume expansion of superheated steam due to carried-off vapour

→ excess steam;

→ recovery of heat and VOCs;

Take out the dried material and recharge again.

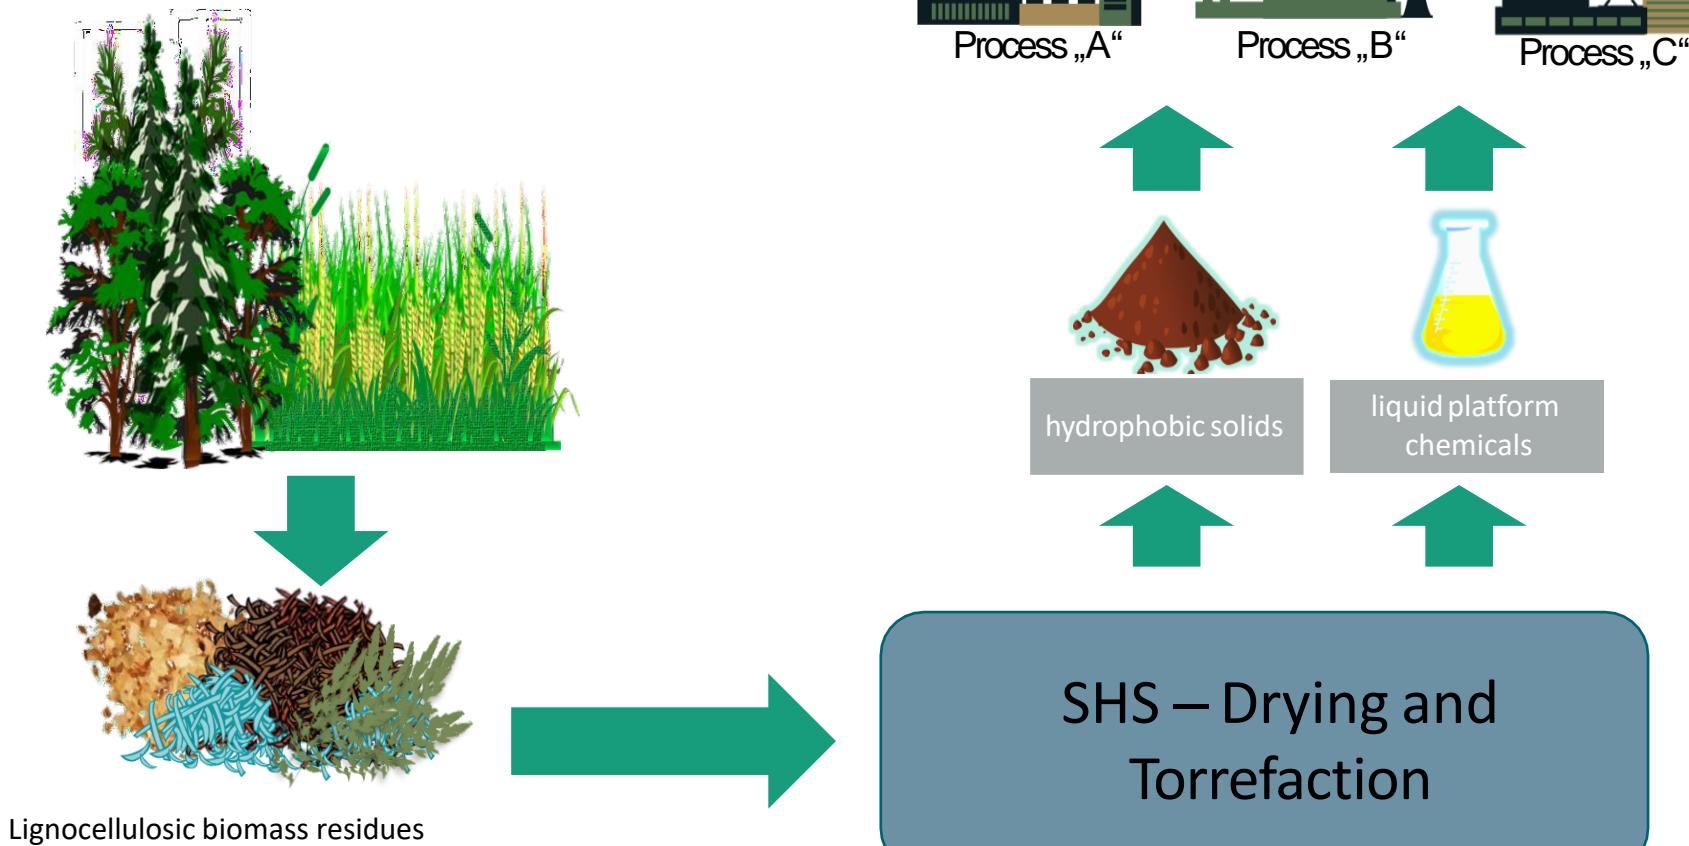

Superheated steam at atmospheric pressure

Advantages of superheated steam (SHS) drying/torrefaction

- Increased heat transfer due to thermodynamic properties of SHS
- Free choice of conveying principles due to operation at atmospheric pressure
- High energy efficiency ^⑦ Up to 90% of supplied energy recoverable
- No oxidative reactions and explosion risks (oxygen-free atmosphere)
- Varying the operational temperature above 120°C allows a range of product treatments from mild drying up to roasting/torrefaction.
- Recovery of condensate as demineralised water at 90°C to 95°C and flavours/aroma compounds (e.g. essential oils) or VOCs
- Recovery of valuable chemicals is possible when operating at torrefaction conditions (200-300°C)
- No harmful emissions and odour nuisances

Superheated steam at atmospheric pressure

Possible Application
